

# 1029 PTSS among Children with Burn Injury

## Abstract

This study investigated PTSS and risk factors among children age 7 - 17 years who were admitted to the hospital after an acute burn injury. Children and parents completed measures of PTSS, anxiety, pain, and other self-report measures of psychopathology and environmental stress during the hospitalization and 3 months post-burn.

## Data

### Analysis Unit

Individual

### Analysis Units Covered

Child exposed to an index potentially traumatic event

## PACT/R Metadata

## Concepts

### PACT/R Topics

- [Demographics](#)
- [Demographics - index child](#)
- [Demographics - parent\(s\) / caretaker\(s\) of index child](#)
- [Index event / trauma exposure](#)
- [Nature of index event / trauma](#)

- Characteristics of child's exposure to index event / trauma
- Characteristics of parent's exposure to index trauma
- Trauma history
- Trauma history of index child
- Trauma history of parent(s) / caretaker(s) of index child
- Mental health symptoms - index child
- Traumatic stress symptoms / responses to trauma
- Depression symptoms
- Anxiety symptoms
- Functional impairment - Quality of life
- Functional impairment - index child
